

MEDAXION 9.5 RELEASE DETAIL

November 26, 2025

The upcoming Medaxion 9.5 release contains multiple capability enhancements and bug fixes. The key user-facing enhancements included in this release:

1. Email login identification
2. Multi-factor authentication (MFA)
3. Anesthesia group selection & management
4. Encounter reprint reminder

Descriptions of key user-facing enhancements (numbered 1-4) and two additional features are provided in sections below.

Audience Note: This document provides background on each noteworthy Medaxion 9.5 addition and assists Medaxion relationship administrators with feature adoption decisions. As such, this release detail is *not intended for provider users*. Consistent with prior releases, a brief “What’s New in 9.5” provider tip sheet will be published as a bulletin within the Medaxion app.

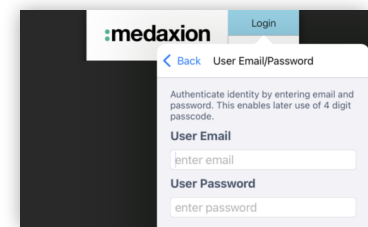

In addition to enhancements, over 20 bugs and performance issues have been addressed in Medaxion 9.5, including management of various iOS-iPadOS 26 impacts. This release requires iOS-iPadOS version 15.6 or later (unchanged from Medaxion 9.4).

The six-week provider beta testing process for Medaxion 9.5 has been completed; AppStore availability is now scheduled for Sunday, November 30, 2025.

1. EMAIL LOGIN IDENTIFICATION

The most prominent change in Medaxion 9.5 involves device user authentication/login. Previously, users initiated the identification process by self-selecting from a user list. Now, users will instead identify themselves by entering their email address. This change improves app security.

Visually, the “User” button is now “Login”. If multi-factor authentication (MFA) or single sign-on (SSO) are not enabled, selecting Login will bring up a simple, single prompt to enter user email and password. The provider user list is no longer displayed. Since password entry was always required, the practical impact on providers here is knowing which email address is tied to their Medaxion identity. See image at right.

Login Email+Password Entry

Important: PIN entry to unlock the app is unchanged. Only the initial provider authentication/login step has been changed.

To login (without MFA or SSO):

On Login view → select “Login” → enter user email & password → select keyboard “Done”

2. MULTI-FACTOR AUTHENTICATION (MFA)

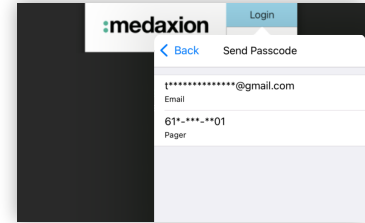

Medaxion previously enabled MFA options for web interface logins and now provides an MFA option for device logins. Most all users are familiar with MFA code entry as a secondary user identity validation on various websites. Medaxion MFA works similarly when enabled.

If MFA for device login is enabled, users will be required to enter a seven digit code as a further identity validation check after email-password entry. The code is sent to the user's login email address -or- user alert mobile number via SMS txt. If a mobile number is configured for the user, they choose between email or SMS code delivery methods. See images at right.

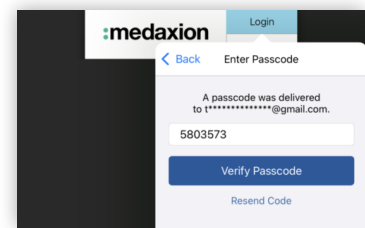

Note: Medaxion clients with single sign-on (SSO) will not use the Medaxion MFA process, as SSO itself provides MFA options, per the SSO system configuration.

To login with MFA (if enabled):

- On Login view → select “Login” → enter email & password
- select “Done” on Keyboard
- [optional if mobile # configured] select code delivery method
- enter MFA code at the prompt → select “Verify Passcode”

Login MFA Code Delivery Method

Login MFA Code Verification

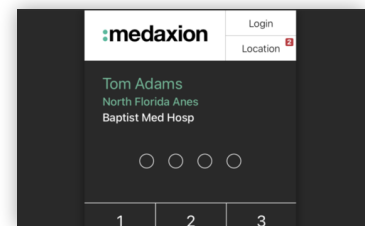

3. ANESTHESIA GROUP SELECTION & MANAGEMENT

After login, the user's anesthesia group is now shown below the user name. Anesthesia group identification was added to enable group selection in those facilities where multiple groups provide service under a single Medaxion installation. See first image below.

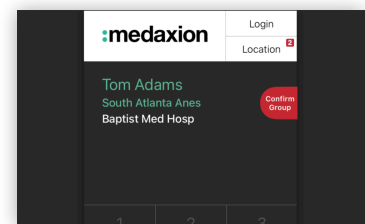

Where appropriate, anesthesia group selection occurs after user login and after Location selection. If a location has just one associated anesthesia group, the user does not need to select a group - it's a given.

Important: if the selected Location has only a single anesthesia group (the default setting), no provider action is required.

This feature allows the known anesthesia group to be tied to each case. In more more complex multi-group facilities, group-case alignment will aid appropriate routing of case data exports and case-level reporting. We have enabled management of facility-specific anesthesia group lists and a mechanism for users to select the group for which they are working that day. The last point is pertinent, as providers in some markets routinely work for more than one group within the same week or even the same day.

Login View w/ 1 Anesthesia Group

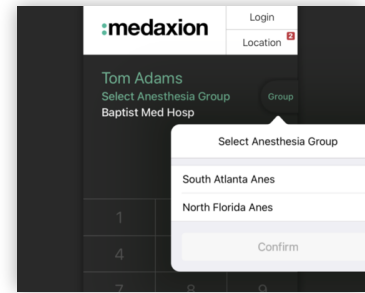

Login w/ Confirm Group Button

In locations with more than one group, the providers make a selection each surgical day. The selection list is location specific, so a change in location will require a new selection. The system prompts providers with a red “Confirm Group” button. See second image above and image on the next page.

After initial confirmation, providers may change their Group affiliation, if needed, via the less prominent “Group” button. See image to right.

In facilities where providers bring their own mobile device and login does not change, the provider just Confirms Group prior to PIN entry. When the red “Confirm Group” button is present, the PIN keypad is not active until group confirmation has been completed.

Login Group Selection Popup

To confirm or change anesthesia group:

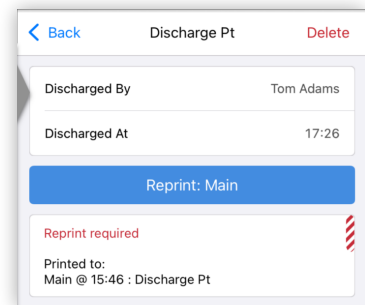

- On Login view → select red “Confirm Group” [or “Group”]
- select group from list → select “Confirm”

3. ENCOUNTER REPRINT REMINDER

To ensure that changes to encounter notes are appropriately reprinted, reprint reminders and print status/history have been added within the note. These notes can include rounding notes and discharge notes.

Reprint reminder is a straightforward: if changes have been made to the encounter, a reprint prompt is shown until a reprint is done. See red “Reprint required” in image to right.

Print status for encounters now matches case print status, after the initial print, the “Print” button changes to “Reprint” with prior print history shown below. See button label and “Printed to...” information in image to right.

Encounter Reprint Button/ Prompt

ADDITIONAL FEATURES

Keypad entry via external keyboard.

For users that attach external keyboards, the number keys on those keyboards now work to complete entry when on-screen keypads are presented.

Date visibility for prior day cases on PostOp tab.

Now dates are shown with times on PostOp prior day cases, consistent with date/time visibility on Remediation Queue cases.
